CodeQuery is a lightweight and easy-to-use application that can help advanced PC users such as software developers understand, browse or search code in a friendly environment. It features multi-language support and has built-in database files to index and query code for various programming languages (C, C++, C#, Java, JavaScript, Objective-C, PHP, Python, Ruby, and Go). Users also get a comprehensive tool with an intuitive GUI. With CodeQuery, source code is grouped into folders based on files' attributes: whether they are source code, header files, binary files or documentation. This can help users rapidly locate relevant data in a friendly environment. Various viewing tools are bundled with CodeQuery: code colorizer, code snippet, and go to definition. Users can customize the component's appearance with preferences. CodeQuery includes a robust source code query engine that can index and query source code from various programming languages, including Ruby, Go, Java, Python, C and C++. More so, the GUI tool has a push-button hint feature. It uses a comprehensive database system with SQLite, which provides fast indexing and queries. Cscope and ctags databases are processed by the tool automatically. As a result, users can start quickly and play with CodeQuery. Database files can be obtained by processing databases of cscope and ctags with the cqmakedb tool. The database consists of two parts: one part is used for indexing and the other for querying. The database is saved as a SQLite file, which makes it compatible with various platforms. Since this component uses SQLite, users can load and query files either through an SQLite prompt or by double-clicking on the database file in the application. The source code query interface also supports wildcard, case-insensitive and partial keyword searches. Users also get results as exact matches. The component also provides multi-language support, making it suitable for business users from various languages and countries. When users search for source code containing "def", they get results with an emphasis on imports and function definitions. A button that says "Search for namespace" in a red badge is used to locate relevant data quickly. Users can also make their search term(s) case-insensitive, use double clicks to open source code lines that match the search term, and perform auto-completion. To ensure the results are correct, CodeQuery lets users use a simple "backup and fix" methodology.

CodeQuery helps developers browse and search source code in a friendly environment. It provides easy-to-use search functionality which supports cross-platform issues, is cross-browser compatible and can access source codes stored in any language. [url removed, login to view] CodeQuery Features: CQUERY supports cross-platform search feature. This means that users can search source codes in C, C++, Java, Objective-C, Ruby, and also other languages. It does not matter if a language is embedded, interpreted or compiled. It searches in program text and keywords included within comments. This cross-platform technology does not involve any specific programs. Thus, it can be used to search programming code in many platforms. CodeQuery also has full support for Unicode, therefore it can search in source codes encoded with Unicode. CodeQuery uses a lightweight database that can be accessed on multiple platforms. It stores source codes extracted from the database files that users can access. It is embedded as part of the tool and does not require users to download additional files. This app also supports the use of remote databases. Moreover, users can be given the choice of storing their data on a remote location or their local device. CodeQuery can also display read-only data that is extracted from a source code. It supports UTF-8 encoding. This allows users to handle source codes that are encoded in a custom file format. The app also has the ability to export search results in a comma separated list format. CodeQuery has the ability to display inline code snippets. This can be useful for viewing code fragments that are small or complex. This feature is useful when the full coding environments are lengthy. CodeQuery can filter results with selectors. This feature allows users to see only selected source codes.
